

BENEFITS

- No equipment on site
- Complete firewall features
- Full packet scanning
- Constant virus definition updates
- Intrusion Detection / Prevention Systems (IDS/IPS)
- Data loss prevention
- Web Filtering
- Access agnostic
- Granular policy changes
- 24x7x365 monitoring, response and support

Protecting your enterprise, from the network in

Fusion's Cloud Unified Threat Management (UTM) service provides full peace of mind with network-based security, content filtering and cost effective Virtual Private Network (VPN). Without requiring a dedicated Internet gateway or firewall on site, Fusion UTM detects and blocks malicious or unwanted traffic before it impacts your network and broadband connectivity. By centralizing the enforcement of your network access policies in the Fusion network, you may efficiently update your network topology without having to reconfigure your security devices. Whether you are using one of Fusion's numerous cloud connectivity solutions, or leveraging a 3rd party failover circuit, rest assured that all your network traffic will be subject to the same security and content policies you have defined for the whole enterprise.

Firewall

With Fusion Firewall, protect your network without equipment deployed at each location. From the network in, you control what applications and content can reach your enterprise. Once policies are established, Fusion provides 24x7x365 monitoring and alert responses. Pricing is flexible and adjusts to your aggregate network bandwidth so you can match your cost with your network needs. Fusion Firewall helps set varying levels of access for different users and applications. Our ongoing monitoring and alerts will help detect, deter and mitigate the impact of cyber attacks and business disruptions.

Content Filtering

With multiple options of static and category-based content filtering, Fusion will help you maximize the use of your network for your business purposes, while keeping unwanted and unproductive web traffic out. Content policies are centrally defined for the entire customer network or by location, and enforced for inbound and outbound traffic as data traverses the security gateways strategically located in the Fusion cloud infrastructure. In addition, enterprise-strength data loss prevention technology monitors outbound traffic to prevent sensitive data from leaving your network.

Antivirus/Antispyware

Viruses, spyware applications and malware threats are created to throw off enterprise defenses, leaving IT staff vulnerable. Fusion anti-virus and anti-spyware definitions and footprint are updated to quickly and effectively maintain the highest level of protection from outside your network infrastructure, before the threat ever impacts your corporate network assets.

Intrusion Detection/Prevention Systems

The Fusion Intrusion Detection System (IDS) scans and reports unwanted traffic for proper action. As threats are more frequent and complex, automated and immediate corrective action must be taken. The Fusion Intrusion Prevention System (IPS) scans real-time traffic in line, and drops malicious packets, blocks traffic from suspect sources and resets network sessions to keep it free of unwanted traffic. Fusion's centralized and enterprise-grade IPS is scaled to rapidly scan and act on all traffic real-time, leaving on-premise equipment free to perform other routing functions.

Remote Office Firewall Security

To maintain complete network integrity and protection, remote customer locations with their own dedicated Internet connections must maintain the same policies as other network locations, with the same effectiveness and speed. Fusion UTM provides Remote Site VPN applications to help protect these locations and keep them in synch with the centrally-managed network assets.

Service Packages

With Fusion UTM, you can select from a variety of options and pricing plans best matched to your security needs. Unlike other security solutions, you may add more locations as your business evolves, with no need for additional equipment and additional fees. What's more, software-client based VPNs are included in all packages at no extra charge (limits apply).

Our Approach to Excellence

At Fusion, we understand your IT environment and communications needs are unique and constantly evolving. Our staff knows what it takes to implement an enterprise-wide cloud solution without any interruption of service. From IP connectivity and network design, equipment installation and training, we handle each Fusion UTM customer engagement as an individual project, with a human touch most service providers can't match.
