Configuration Note Notices

#### **Notice**

This document describes how to connect the Microsoft Lync Server 2013 and Broadvox SIP Trunk using AudioCodes Mediant E-SBC product series, which includes the Mediant 800 Gateway & E-SBC, Mediant 1000B Gateway & E-SBC, Mediant 3000 Gateway & E-SBC, and Mediant 4000 E-SBC.

Information contained in this document is believed to be accurate and reliable at the time of printing. However, due to ongoing product improvements and revisions, AudioCodes cannot guarantee accuracy of printed material after the Date Published, nor can it accept responsibility for errors or omissions. Updates to this document and other documents as well as software files can be viewed by registered customers at <a href="http://www.audiocodes.com/downloads">http://www.audiocodes.com/downloads</a>.

#### **WEEE EU Directive**

Pursuant to the WEEE EU Directive, electronic and electrical waste must not be disposed of with unsorted waste. Please contact your local recycling authority for disposal of this product.

#### **Customer Support**

Customer technical support and service are generally provided by AudioCodes' Distributors, Partners, and Resellers from whom the product was purchased. For technical support for products purchased directly from AudioCodes, or for customers subscribed to AudioCodes Customer Technical Support (ACTS), contact <a href="mailto:support@audiocodes.com">support@audiocodes.com</a>.

#### **Documentation Feedback**

AudioCodes continually strives to produce high quality documentation. If you have any comments (suggestions or errors) regarding this document, please fill out the Documentation Feedback form on our Web site at <a href="http://www.audiocodes.com/downloads">http://www.audiocodes.com/downloads</a>.

#### **Reader's Notes**

Configuration Note 1. Introduction

#### 1 Introduction

This Configuration Note describes how to set up the AudioCodes Enterprise Session Border Controller (hereafter, referred to as *E-SBC*) for interworking between Broadvox's SIP Trunk and Microsoft's Lync Server 2013 environment.

#### 1.1 Intended Audience

The document is intended for engineers, or AudioCodes and Broadvox Partners who are responsible for installing and configuring Broadvox's SIP Trunk and Microsoft's Lync Server 2013 for enabling VoIP calls using AudioCodes E-SBC.

#### 1.2 About AudioCodes E-SBC Product Series

AudioCodes' family of E-SBC devices enables reliable connectivity and security between the Enterprise's and the service provider's VoIP networks.

The E-SBC provides perimeter defense as a way of protecting Enterprises from malicious VoIP attacks; mediation for allowing the connection of any PBX and/or IP-PBX to any service provider; and Service Assurance for service quality and manageability.

Designed as a cost-effective appliance, the E-SBC is based on field-proven VoIP and network services with a native host processor, allowing the creation of purpose-built multiservice appliances, providing smooth connectivity to cloud services, with integrated quality of service, SLA monitoring, security and manageability. The native implementation of SBC provides a host of additional capabilities that are not possible with standalone SBC appliances such as VoIP mediation, PSTN access survivability, and third-party value-added services applications. This enables Enterprises to utilize the advantages of converged networks and eliminate the need for standalone appliances.

AudioCodes E-SBC is available as an integrated solution running on top of its field-proven Mediant Media Gateway and Multi-Service Business Router platforms, or as a software-only solution for deployment with third-party hardware.

# 2.4 Interoperability Test Topology

The interoperability testing between AudioCodes E-SBC and Broadvox SIP Trunk with Lync 2013 was done using the following topology setup:

- Enterprise deployed with Microsoft Lync Server 2013 in its private network for enhanced communication within the Enterprise.
- Enterprise wishes to offer its employees Enterprise-voice capabilities and to connect the Enterprise to the PSTN network using Broadvox's SIP Trunking service.
- AudioCodes E-SBC is implemented to interconnect between the Enterprise LAN and the SIP Trunk.
  - **Session:** Real-time voice session using the IP-based Session Initiation Protocol (SIP).
  - **Border:** IP-to-IP network border between Lync Server 2013 network in the Enterprise LAN and Broadvox's SIP Trunk located in the public network.

The figure below illustrates this interoperability test topology:

Figure 2-1: Interoperability Test Topology between E-SBC and Microsoft Lync with Broadvox SIP Trunk

#### 2.4.1 Environment Setup

The interoperability test topology includes the following environment setup:

**Table 2-4: Environment Setup** 

Area	Setup
Network	<ul> <li>Microsoft Lync Server 2013 environment is located on the Enterprise's LAN</li> <li>Broadvox SIP Trunk is located on the WAN</li> </ul>
Signaling Transcoding	<ul> <li>Microsoft Lync Server 2013 operates with SIP-over-TLS transport type</li> <li>Broadvox SIP Trunk operates with SIP-over-UDP or TCP transport type</li> </ul>
Codecs Transcoding	<ul> <li>Microsoft Lync Server 2013 supports G.711A-law and G.711U-law coders</li> <li>Broadvox SIP Trunk supports G.711U-law and G.729 coders</li> </ul>
Media Transcoding	<ul> <li>Microsoft Lync Server 2013 operates with SRTP media type</li> <li>Broadvox SIP Trunk operates with RTP media type</li> </ul>

#### 2.4.2 Known Limitations

The following limitation was observed in the Interoperability tests done for the AudioCodes E-SBC interworking between Microsoft Lync Server 2013 and Broadvox's SIP Trunk:

- If any of following Error Responses are sent from the Lync server:
  - Lync Client reject call with "603 Decline"
  - Lync Client set as DnD and send "480 Temporarily Unavailable"
  - Lync Client response with "404 Not Found"
  - Lync Client response with "503 Service Unavailable"

Broadvox disconnects the call only after a number of additional re-INVITES are sent.

#### **Reader's Notes**

# 3 Configuring Lync Server 2013

This chapter describes how to configure Microsoft Lync Server 2013 to operate with AudioCodes E-SBC.

**Note:** Dial plans, voice policies, and PSTN usages are also necessary for Enterprise voice deployment; however, they are beyond the scope of this document.

#### 3.1 Configuring the E-SBC as an IP / PSTN Gateway

The procedure below describes how to configure the E-SBC as an IP / PSTN Gateway.

- ➤ To configure E-SBC as IP/PSTN Gateway and associate it with Mediation Server:
- On the server where the Topology Builder is installed, start the Lync Server 2013 Topology Builder (Windows Start menu > All Programs > Lync Server Topology Builder), as shown below:

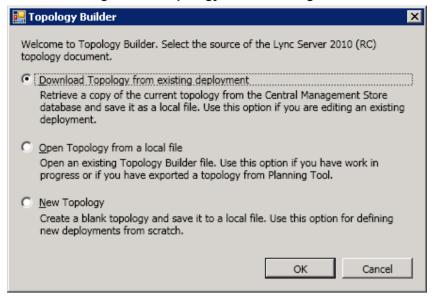

n Default Programs 🎑 Internet Explorer (64-bit) 🚝 Internet Explorer 🚺 Windows Media Player Windows Update Administrator Accessories Administrative Tools Documents Maintenance. Microsoft Lync Server 2013 FE15 Range Server Control Panel B Lync Server Deployment Wizard Network Lync Server Management Shell 🔀 Lync Server Topology Builder Control Panel Microsoft Silverlight Nicrosoft SQL Server 2008 Devices and Printers Microsoft SQL Server 2012 Startup Administrative Tools Help and Support Run... Windows Security Back Log off ▶ Search programs and files P

Figure 3-1: Starting the Lync Server Topology Builder

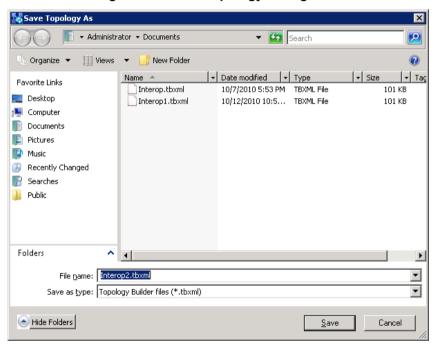

The following is displayed:

Figure 3-2: Topology Builder Dialog Box

Select the Download Topology from existing deployment option, and then click OK; you are prompted to save the downloaded Topology:

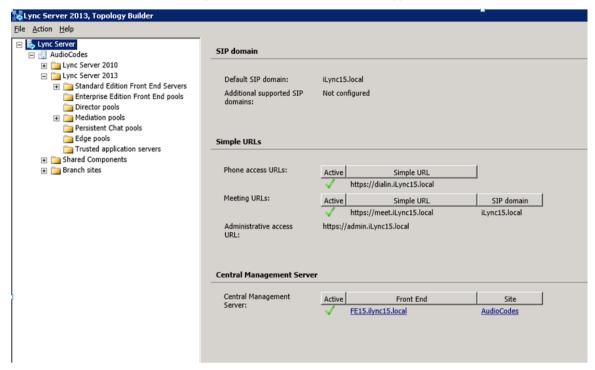

Figure 3-3: Save Topology Dialog Box

**3.** Enter a name for the Topology file, and then click **Save**. This step enables you to roll back from any changes you make during the installation.

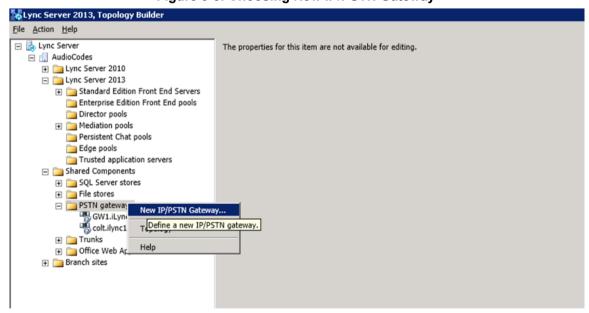

The Topology Builder screen with the downloaded Topology is displayed:

Figure 3-4: Downloaded Topology

4. Under the **Shared Components** node, right-click the **PSTN gateways** node, and then from the shortcut menu, choose **New IP/PSTN Gateway**, as shown below:

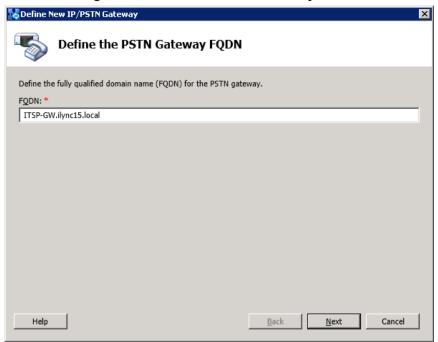

Figure 3-5: Choosing New IP/PSTN Gateway

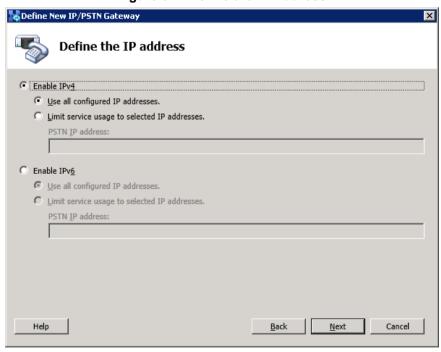

The following is displayed:

Figure 3-6: Define the PSTN Gateway FQDN

5. Enter the Fully Qualified Domain Name (FQDN) of the E-SBC (e.g., ITSP-GW.ilync15.local). Update this FQDN in the relevant DNS record, and then click Next; the following is displayed:

Figure 3-7: Define the IP Address

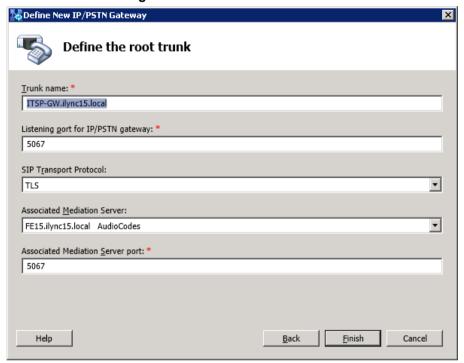

- Define the listening mode (IPv4 or IPv6) of the IP address of your new PSTN gateway, and then click Next.
- 7. Define a root trunk for the PSTN gateway. A trunk is a logical connection between the Mediation Server and a gateway uniquely identified by the following combination: Mediation Server FQDN, Mediation Server listening port (TLS or TCP), gateway IP and FQDN, and gateway listening port.

# **♠**

#### **Notes:**

- When defining a PSTN gateway in Topology Builder, you must define a root trunk to successfully add the PSTN gateway to your topology.
- The root trunk cannot be removed until the associated PSTN gateway is removed.

Figure 3-8: Define the Root Trunk

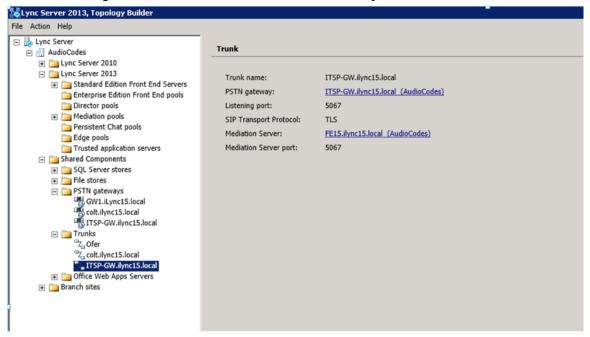

- a. In the 'Listening Port for IP/PSTN Gateway' field, enter the listening port that the E-SBC will use for SIP messages from the Mediation Server that will be associated with the root trunk of the PSTN gateway (e.g., **5067**).
- **b.** In the 'SIP Transport Protocol' field, select the transport type (e.g., **TLS**) that the trunk uses.
- **c.** In the 'Associated Mediation Server' field, select the Mediation Server pool to associate with the root trunk of this PSTN gateway.
- **d.** In the 'Associated Mediation Server Port' field, enter the listening port that the Mediation Server will use for SIP messages from the SBC (e.g., **5067**).
- e. Click Finish.

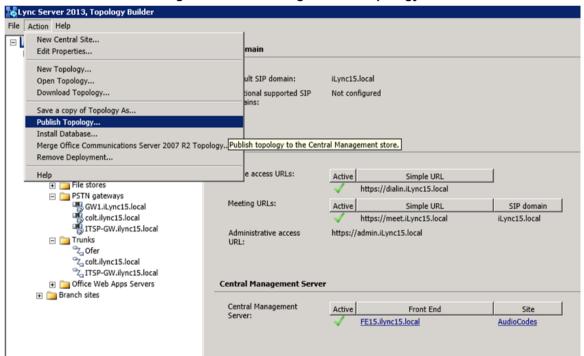

The E-SBC is added as a PSTN gateway, and a trunk is created as shown below:

Figure 3-9: E-SBC added as IP/PSTN Gateway and Trunk Created

B. Publish the Topology: In the main tree, select the root node **Lync Server**, and then from the **Action** menu, choose **Publish Topology**, as shown below:

Figure 3-10: Choosing Publish Topology

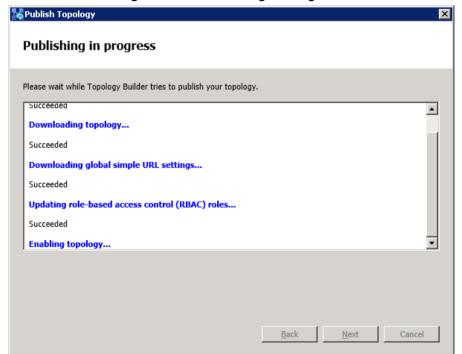

The following is displayed:

Figure 3-11: Publish the Topology

9. Click **Next**; the Topology Builder starts to publish your topology, as shown below:

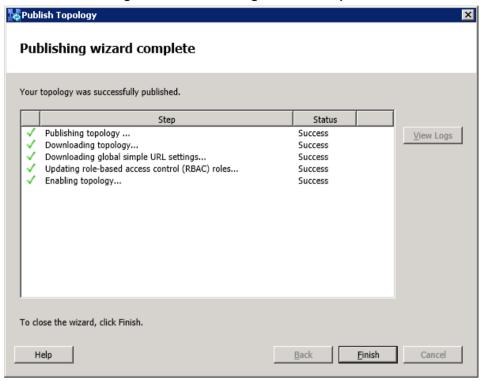

Figure 3-12: Publishing in Progress

**10.** Wait until the publishing topology process completes successfully, as shown below:

Figure 3-13: Publishing Wizard Complete

11. Click Finish.

#### 3.2 Configuring the "Route" on Lync Server 2013

The procedure below describes how to configure a "Route" on the Lync Server 2013 and to associate it with the E-SBC PSTN gateway.

- > To configure the "route" on Lync Server 2013:
- Start the Microsoft Lync Server 2013 Control Panel (Start > All Programs > Microsoft Lync Server 2013 > Lync Server Control Panel), as shown below:

Figure 3-14: Opening the Lync Server Control Panel

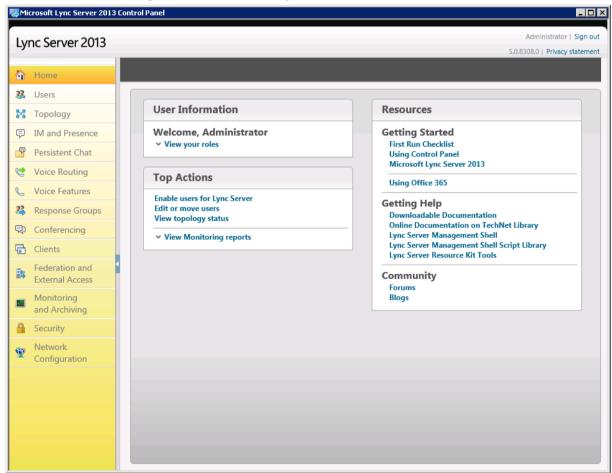

You are prompted to enter your login credentials:

Figure 3-15: Lync Server Credentials

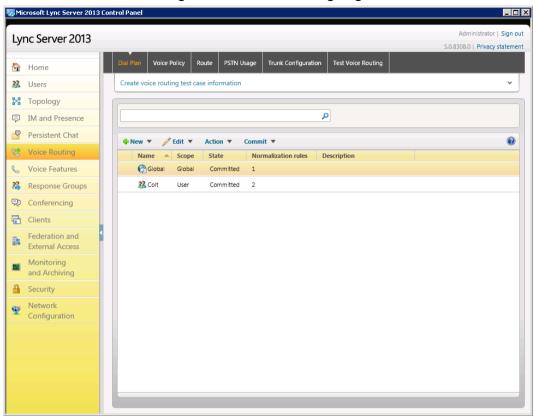

2. Enter your domain username and password, and then click **OK**; the Microsoft Lync Server 2013 Control Panel is displayed:

Figure 3-16: Microsoft Lync Server 2013 Control Panel

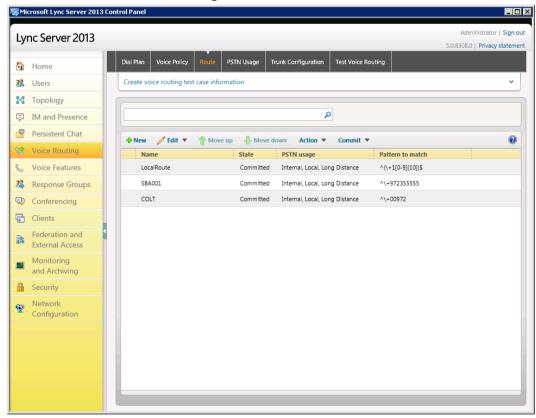

3. In the left navigation pane, select Voice Routing.

Figure 3-17: Voice Routing Page

4. In the Voice Routing page, select the **Route** tab.

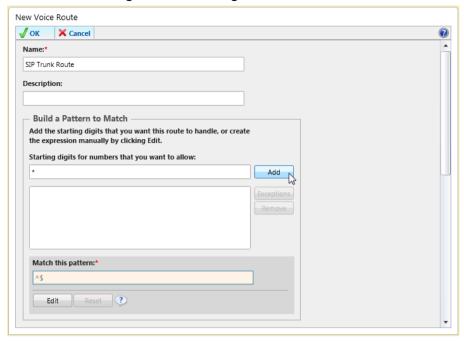

Figure 3-18: Route Tab

5. Click **New**; the New Voice Route page appears:

Figure 3-19: Adding New Voice Route

- 6. In the 'Name' field, enter a name for this route (e.g., SIP Trunk Route).
- 7. In the 'Starting digits for numbers that you want to allow' field, enter the starting digits you want this route to handle (e.g., \* to match all numbers), and then click **Add**.

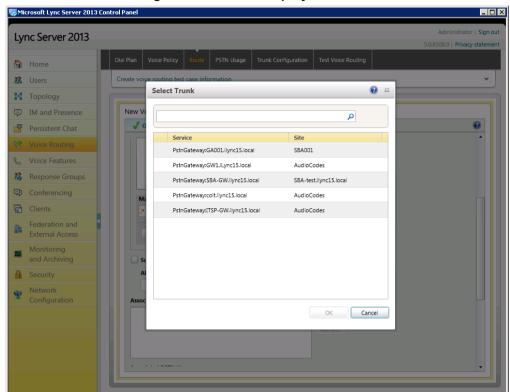

🌄 Microsoft Lync Server 2013 Control Panel Administrator | Sign out Lync Server 2013 5.0.8308.0 | Privacy statement 4 Home Users Create voice routing test case information Topology New Voice Route ■ IM and Presence √ OK

Monitoring and Archiving Suppress caller ID Alternate caller ID: Security Network Configuration Associated trunks: Add... . . . - - - . . .

Figure 3-20: Adding New Trunk

- 8. Associate the route with the E-SBC Trunk that you created:
  - a. Under the 'Associated Trunks' group, click Add; a list of all the deployed gateways is displayed:

Figure 3-21: List of Deployed Trunks

**b.** Select the E-SBC Trunk you created, and then click **OK**; the trunk is added to the 'Associated Trunks' group list:

rator | Sign out Lync Server 2013 Route PSTN Usage Trunk Configuration Test Voice Routing Home Create voice routing test case information 23 Users New Voice Route √ OK 

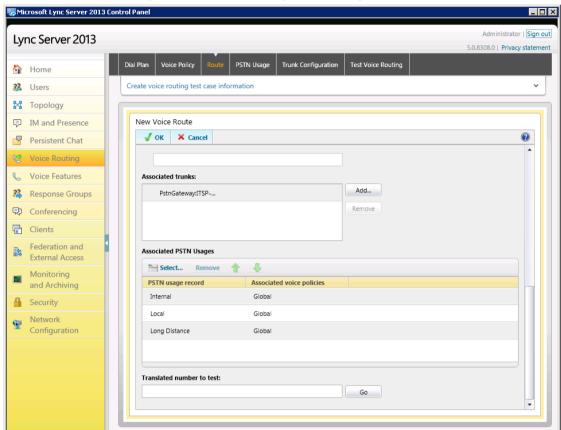

X Cancel **?** Exceptions Voice Features Response Groups Conferencing Match this pattern: \* Clients Federation and External Access Edit Reset ? Monitoring and Archiving Suppress caller ID Security Alternate caller ID: Network Configuration Associated trunks: Add... PstnGateway:ITSP-... Remove - ....

Figure 3-22: Selected E-SBC Trunk

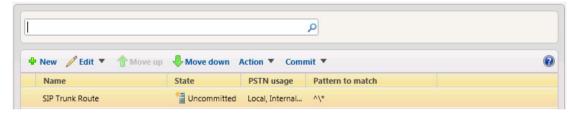

- Associate a PSTN Usage to this route:
  - Under the 'Associated PSTN Usages' group, click Select and then add the associated PSTN Usage.

Figure 3-23: Associating PSTN Usage to Route

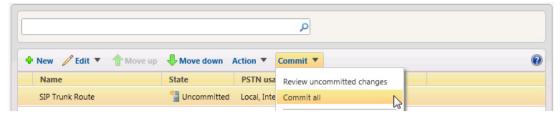

**10.** Click **OK** (located on the top of the New Voice Route page); the New Voice Route (Uncommitted) is displayed:

Figure 3-24: Confirmation of New Voice Route

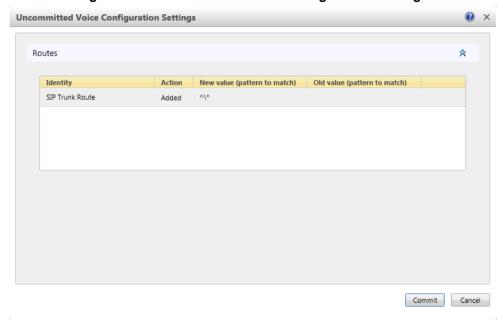

11. From the Commit drop-down list, choose Commit all, as shown below:

Figure 3-25: Committing Voice Routes

The Uncommitted Voice Configuration Settings page appears:

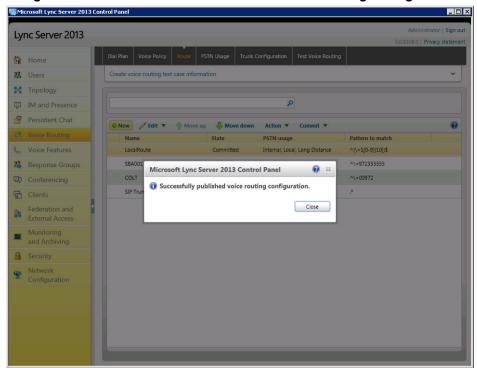

Figure 3-26: Uncommitted Voice Configuration Settings

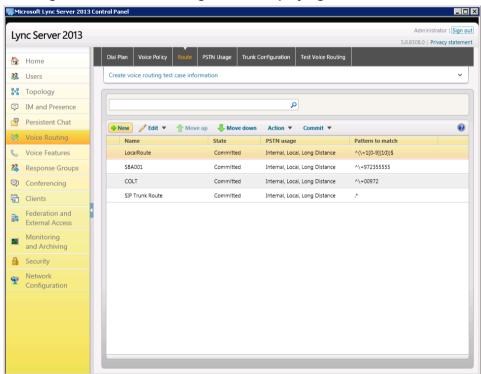

12. Click Commit; a message is displayed confirming a successful voice routing configuration, as shown below:

Figure 3-27: Confirmation of Successful Voice Routing Configuration

**13.** Click **Close**; the new committed Route is displayed in the Voice Routing page, as shown below:

Figure 3-28: Voice Routing Screen Displaying Committed Routes

# 4 Configuring AudioCodes E-SBC

This chapter provides step-by-step procedures on how to configure AudioCodes E-SBC for interworking between Microsoft Lync Server 2013 and the Broadvox SIP Trunk. These configuration procedures are based on the interoperability test topology described in Section 2.4 on page 12, and includes the following main areas:

- E-SBC WAN interface Broadvox SIP Trunking environment
- E-SBC LAN interface Lync Server 2013 environment

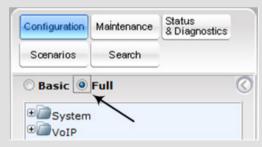

This configuration is done using the E-SBC's embedded Web server (hereafter, referred to as *Web interface*).

#### Notes:

- For implementing Microsoft Lync and Broadvox SIP Trunk based on the configuration described in this section, AudioCodes E-SBC must be installed with a Software License Key that includes the following software features:
  - √ Microsoft
  - √ SBC
  - √ Security
  - √ DSP
  - √ RTP
  - √ SIP

For more information about the Software License Key, contact your AudioCodes sales representative.

- The scope of this document does not cover security aspects for connecting the SIP Trunk to the Microsoft Lync environment. Security measures should be implemented in accordance with your organization's security policies. For basic security guidelines, refer to the Recommended Security Guidelines document.
- Before you begin configuring the E-SBC, ensure that the E-SBC's Web interface Navigation tree is in Full-menu display mode. To do this, select the Full option, as shown below:

 When the E-SBC is reset, the Navigation tree reverts to the Basic-menu display.

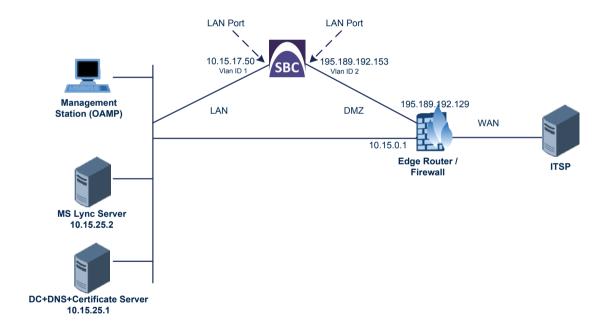

#### 4.1 Step 1: IP Network Interfaces Configuration

This step describes how to configure the E-SBC's IP network interfaces. There are several ways to deploy the E-SBC; however, this interoperability test topology employs the following deployment method:

- E-SBC interfaces with the following IP entities:
  - Lync servers, located on the LAN
  - Broadvox SIP Trunk, located on the WAN
- E-SBC connects to the WAN through a DMZ network
- Physical connection: The type of physical connection to the LAN depends on the method used to connect to the Enterprise's network. In the interoperability test topology, E-SBC connects to the LAN and WAN using dedicated LAN ports (i.e., two ports and two network cables are used).
- E-SBC also uses two logical network interfaces:
  - LAN (VLAN ID 1)
  - WAN (VLAN ID 2)

Figure 4-1: Network Interfaces in Interoperability Test Topology

# 4.1.1 Step 1a: Configure Network Interfaces

This step describes how to configure the IP network interfaces for each of the following interfaces:

- LAN VoIP (assigned the name "Voice")
- WAN VoIP (assigned the name "WANSP")
- > To configure the IP network interfaces:
- Open the IP Interfaces Table page (Configuration tab > VoIP menu > Network > IP Interfaces Table).
- 2. Modify the existing LAN network interface:
  - Select the 'Index' radio button of the OAMP + Media + Control table row, and then click Edit.
  - **b.** Configure the interface as follows:

Parameter	Value
IP Address	<b>10.15.17.50</b> (IP address of E-SBC)
Prefix Length	<b>16</b> (subnet mask in bits for 255.255.0.0)
Gateway	10.15.0.1
VLAN ID	1
Interface Name	Lync (arbitrary descriptive name)
Primary DNS Server IP Address	10.15.25.1
Underlying Interface	GROUP_1 (Ethernet port group)

- 3. Add a network interface for the WAN side:
  - a. Enter 1, and then click Add Index.
  - **b.** Configure the interface as follows:

Parameter	Value		
Application Type	Media + Control		
IP Address	<b>195.189.192.157</b> (WAN IP address)		
Prefix Length	<b>25</b> (for 255.255.255.128)		
Gateway	<b>195.189.192.129</b> (router's IP address)		
VLAN ID	2		
Interface Name	Broadvox		
Primary DNS Server IP Address	80.179.52.100		
Secondary DNS Server IP Address	80.179.55.100		
Underlying Interface	GROUP_2		

4. Click **Apply**, and then **Done**.

The configured IP network interfaces are shown below:

Figure 4-2: Configured Network Interfaces in IP Interfaces Table

#### 4.1.2 Step 1b: Configure the Native VLAN ID

This step describes how to configure the Native VLAN ID for the LAN and WAN interfaces.

- > To configure the Native VLAN ID for the IP network interfaces:
- Open the Physical Ports Settings page (Configuration tab> VolP menu > Network > Physical Ports Table).
- For the GROUP\_1 member ports, set the 'Native Vlan' field to 1. This VLAN was assigned to network interface "Voice".
- 3. For the **GROUP\_2** member ports, set the 'Native Vlan' field to 2. This VLAN was assigned to network interface "WANSP".

Figure 4-3: Configured Port Native VLAN

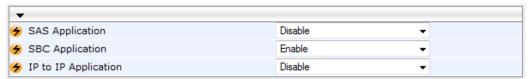

Index	Port	Mode	Native Vlan	Speed&Duplex	Description	Group Member	Group Status
1 0	GE_4_1	Enable	1	Auto Negotiation	User Port #0	GROUP_1	Active
2 🔘	GE_4_2	Enable	1	Auto Negotiation	User Port #1	GROUP_1	Redundant
3 🔘	GE_4_3	Enable	2	Auto Negotiation	User Port #2	GROUP_2	Active
4 🔘	GE_4_4	Enable	2	Auto Negotiation	User Port #3	GROUP_2	Redundant

# 4.2 Step 2: Enable the SBC Application

This step describes how to enable the SBC application.

- > To enable the SBC application:
- 1. Open the Applications Enabling page (Configuration tab > VoIP menu > Applications Enabling > Applications Enabling).

Figure 4-4: Enabling SBC Application

- 2. From the 'SBC Application' drop-down list, select Enable.
- 3. Click Submit.
- **4.** Reset the E-SBC with a burn to flash for this setting to take effect (see Section 4.15 on page 70).

#### 4.3 Step 3: Signaling Routing Domains Configuration

This step describes how to configure Signaling Routing Domains (SRD). The SRD represents a logical VoIP network. Each logical or physical connection requires an SRD, for example, if the E-SBC interfaces with both the LAN and WAN, a different SRD would be required for each one.

The SRD is composed of the following:

- Media Realm: Defines a UDP port range for RTP/SRTP (media) traffic on a specific logical IP network interface of the E-SBC.
- SIP Interface: Defines a listening port and type (UDP, TCP, or TLS) for SIP signaling traffic on a specific logical IP network interface of the E-SBC.

#### 4.3.1 Step 3a: Configure Media Realms

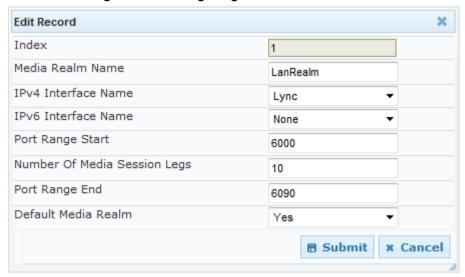

This step describes how to configure Media Realms. The simplest configuration is to create two Media Realms - one for internal (LAN) traffic and one for external (WAN) traffic.

#### To configure Media Realms:

- Open the Media Realm Table page (Configuration tab > VolP menu > Media > Media Realm Table).
- 2. Configure a Media Realm for LAN traffic:

Parameter	Value
Index	1
Media Realm Name	LanRealm (descriptive name)
IPv4 Interface Name	Lync
Port Range Start	<b>6000</b> (represents lowest UDP port number used for media on LAN)
Number of Media Session Legs	10 (media sessions assigned with port range)

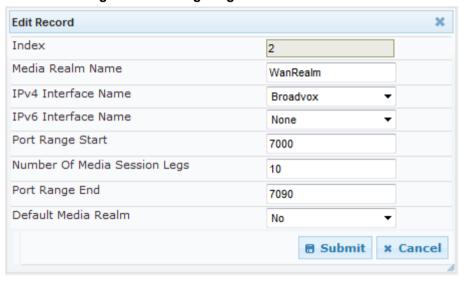

Figure 4-5: Configuring Media Realm for LAN

3. Configure a Media Realm for WAN traffic:

Parameter	Value
Index	2
Media Realm Name	WanRealm (arbitrary name)
IPv4 Interface Name	Broadvox
Port Range Start	<b>7000</b> (represents lowest UDP port number used for media on WAN)
Number of Media Session Legs	10 (media sessions assigned with port range)

Figure 4-6: Configuring Media Realm for WAN

The configured Media Realms are shown in the figure below:

Figure 4-7: Configured Media Realms in Media Realm Table

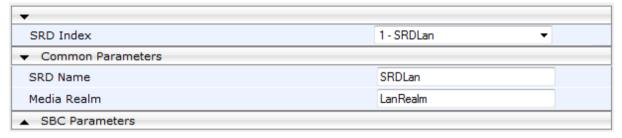

### 4.3.2 Step 3b: Configure SRDs

This step describes how to configure the SRDs.

- ➤ To configure SRDs:
- Open the SRD Settings page (Configuration tab > VolP menu > Control Network > SRD Table).
- 2. Configure an SRD for the E-SBC's internal interface (toward Lync Server 2013):

Parameter	Value
SRD Index	1
SRD Name	SRDLan (descriptive name for SRD)
Media Realm	LanRealm (associates SRD with Media Realm)

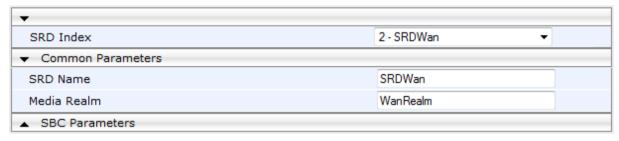

Figure 4-8: Configuring LAN SRD

Configure an SRD for the E-SBC's external interface (toward the Broadvox SIP Trunk):

Parameter	Value
SRD Index	2
SRD Name	SRDWan
Media Realm	WanRealm

Figure 4-9: Configuring WAN SRD

### 4.3.3 Step 3c: Configure SIP Signaling Interfaces

This step describes how to configure SIP Interfaces. For the interoperability test topology, an internal and external SIP Interface must be configured for the E-SBC.

- > To configure SIP Interfaces:
- 1. Open the SIP Interface Table page (Configuration tab > VoIP menu > Control Network > SIP Interface Table).
- 2. Configure a SIP interface for the LAN:

Parameter	Value
Index	1
Network Interface	Lync
Application Type	SBC
TCP and UDP	0
TLS Port	5067
SRD	1

3. Configure a SIP interface for the WAN:

Parameter	Value
Index	2
Network Interface	Broadvox
Application Type	SBC
UDP and TCP Port	5060
TLS	0
SRD	2

The configured SIP Interfaces are shown in the figure below:

Figure 4-10: Configured SIP Interfaces in SIP Interface Table

### 4.4 Step 4: Configure Proxy Sets

This step describes how to configure Proxy Sets. The Proxy Set defines the destination address (IP address or FQDN) of the IP entity server. Proxy Sets can also be used to configure load balancing between multiple servers.

For the interoperability test topology, two Proxy Sets need to be configured for the following IP entities:

- Microsoft Lync Server 2013
- Broadvox SIP Trunk

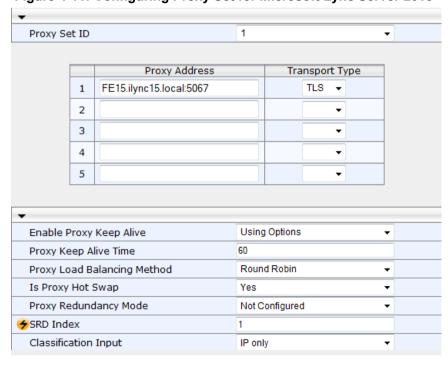

These Proxy Sets will later be associated with IP Groups.

#### To configure Proxy Sets:

- Open the Proxy Sets Table page (Configuration tab > VolP menu > Control Network > Proxy Sets Table).
- 2. Configure a Proxy Set for Lync Server 2013:

Parameter	Value
Proxy Set ID	1
Proxy Address	FE15.ilync15.local:5067 (Lync Server 2013 IP address / FQDN and destination port)
Transport Type	TLS
Enable Proxy Keep Alive	Using Options
Proxy Load Balancing Method	Round Robin
Is Proxy Hot Swap	Yes
SRD Index	1

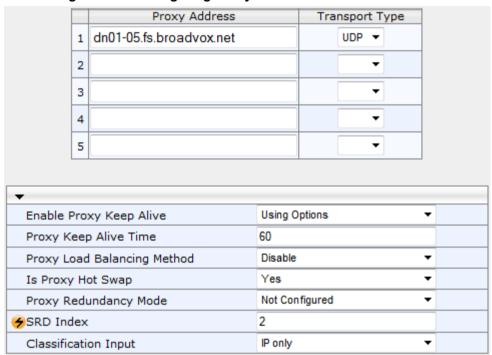

Figure 4-11: Configuring Proxy Set for Microsoft Lync Server 2013

3. Configure a Proxy Set for the Broadvox SIP Trunk:

Parameter	Value
Proxy Set ID	2
Proxy Address	dn01-05.fs.broadvox.net (Broadvox IP address / FQDN)
Transport Type	UDP
Enable Proxy Keep Alive	Using Options
Is Proxy Hot Swap	Yes
SRD Index	2 (enables classification by Proxy Set for SRD of IP Group belonging to Broadvox SIP Trunk)

Figure 4-12: Configuring Proxy Set for Broadvox SIP Trunk

Reset the E-SBC with a burn to flash for these settings to take effect (see Section 4.15 on page 70).

### 4.5 Step 5: Configure IP Groups

This step describes how to configure IP Groups. The IP Group represents an IP entity on the network with which the E-SBC communicates. This can be a server (e.g., IP PBX or ITSP) or it can be a group of users (e.g., LAN IP phones). For servers, the IP Group is typically used to define the server's IP address by associating it with a Proxy Set. A typical deployment consists of multiple IP Groups associated with the same SRD. For example, you can have two LAN IP PBXs sharing the same SRD, and two ITSPs / SIP Trunks sharing the same SRD. Once IP Groups are configured, they are used to configure IP-to-IP routing rules for denoting source and destination of the call.

In this interoperability test topology, IP Groups must be configured for the following IP entities:

- Lync Server 2013 (Mediation Server) located on LAN
- Broadvox SIP Trunk located on WAN

#### > To configure IP Groups:

- 1. Open the IP Group Table page (Configuration tab > VoIP menu > Control Network > IP Group Table).
- 2. Configure an IP Group for the Lync Server 2013 Mediation Server:

Parameter	Value
Index	1
Туре	Server
Description	Lync (arbitrary descriptive name)
Proxy Set ID	1
SIP Group Name	
SRD	1
Media Realm Name	LanRealm
IP Profile ID	1

3. Configure an IP Group for the Broadvox SIP Trunk:

Parameter	Value
Index	2
Туре	Server
Description	Broadvox (arbitrary descriptive name)
Proxy Set ID	2
SIP Group Name	broadvox.net
SRD	2
Media Realm Name	WanRealm
IP Profile ID	2

The configured IP Groups are shown in the figure below:

Figure 4-13: Configured IP Groups in IP Group Table

# 4.6 Step 6: Configure IP Profiles

This step describes how to configure IP Profiles. The IP Profile defines a set of call capabilities relating to signaling (e.g., SIP message terminations such as REFER) and media (e.g., coder and transcoding method).

In this interoperability test topology, IP Profiles need to be configured for the following IP entities:

- Microsoft Lync Server 2013 to operate in secure mode using SRTP and TLS
- Broadvox SIP trunk to operate in non-secure mode using RTP and UDP

Note that the IP Profiles were assigned to these entities (i.e., IP Groups) in the previous step (see Section 4.5 on page 42).

#### > To configure IP Profiles:

- 1. Open the IP Profile Settings page (Configuration tab > VoIP > Coders and Profiles > IP Profile Settings).
- 2. Configure an IP Profile for Lync Server 2013:

Parameter	Value
Profile ID	1
Media Security Behavior	SRTP
SBC Session Expires Mode	Supported
SBC Remote Early Media RTP	<b>Delayed</b> (required, as Lync Server 2013 does not send RTP immediately to remote side when it sends a SIP 18x response)
SBC Remote Update Support	Supported Only After Connect
SBC Remote Re-Invite Support	Supported Only With SDP
SBC Remote REFER Behavior	<b>Handle Locally</b> (required, as Lync Server 2013 does not support receipt of SIP REFER)
SBC Remote 3xx Behavior	Handle Locally (required, as Lync Server 2013 does not support receipt of SIP 3xx responses)
SBC Remote Delayed Offer Support	Not Supported
SBC PRACK Mode	<b>Optional</b> (required, as Broadvox does not support PRACK)

#### Reset SRTP State Upon Rekey

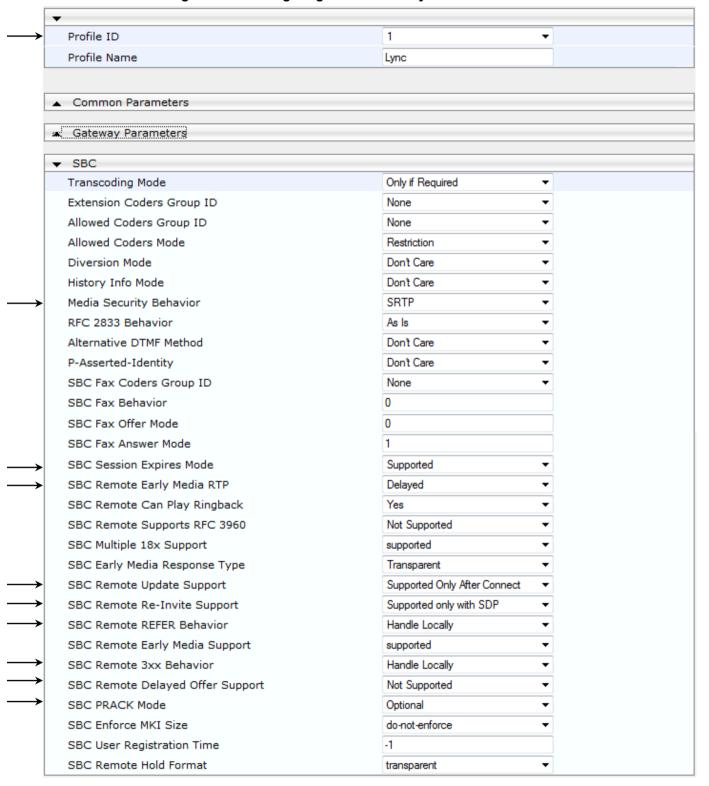

#### **Enable**

**Note:** Currently, you cannot configure this parameter through the Web-based management tool. As an alternative, use the *ini* configuration file, as follows:

- 1 When you have completed **all** configurations, save the configuration to an INI file (see Appendix A on page 71Appendix A).
- 2 Open the file and search for "IpProfile 1".
- 3 For this IP Profile, set the IpProfile\_ResetSRTPStateUponRekey parameter to "1". This value is located sixth from the end of the line (i.e., semicolon): "1, 0, 1, 0, 3, 0;"
- 4 Save the file and load it to the device.

Figure 4-14: Configuring IP Profile for Lync Server 2013

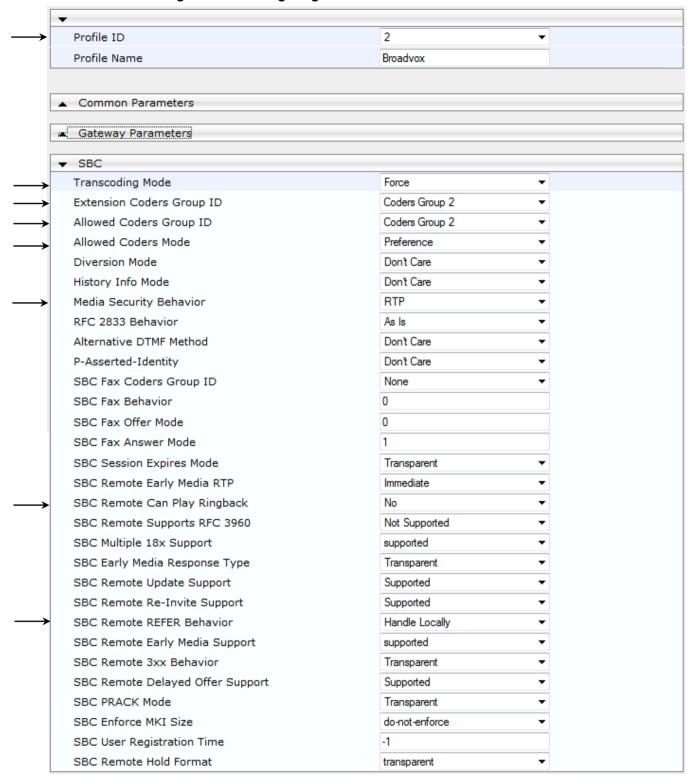

### 3. Configure an IP Profile for the Broadvox SIP Trunk:

Parameter	Value
Profile ID	2
Transcoding Mode	<b>Force</b> (required, as Broadvox does not send RTCP packets)
Extension Coders Group ID	Coders Group 2
Allowed Coders Group ID	Coders Group 2
Allowed Coders Mode	<b>Preference</b> (lists Allowed Coders first and then original coders in received SDP offer)
Media Security Behavior	RTP
SBC Remote Can Play Ringback	<b>No</b> (required, as Lync Server 2013 does not provide a ringback tone for incoming calls)
SBC Remote Refer Behavior	Handle Locally (E-SBC handles / terminates incoming REFER requests instead of forwarding them to SIP Trunk)

Figure 4-15: Configuring IP Profile for Broadvox SIP Trunk

### 4.7 Step 7: Configure Coders

This step describes how to configure coders (termed *Coder Group*). As Lync Server 2013 supports the G.711 coder while the network connection to Broadvox SIP Trunk may restrict operation with a lower bandwidth coder such as G.729, you need to add a Coder Group with the G.729 coder for the Broadvox SIP Trunk.

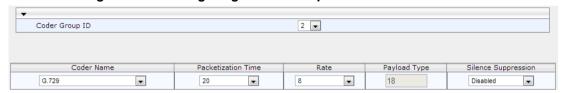

Note that the Coder Group ID for this entity was assigned to its corresponding IP Profile in the previous step (see Section 4.6 on page 44).

#### > To configure coders:

- 1. Open the Coder Group Settings (Configuration tab > VolP menu > Coders and Profiles > Coders Group Settings).
- 2. Configure a Coder Group for Broadvox SIP Trunk:

Parameter	Value
Coder Group ID	2
Coder Name	G.729

Figure 4-16: Configuring Coder Group for Broadvox SIP Trunk

The procedure below describes how to configure an Allowed Coders Group to ensure that voice sent to the Broadvox SIP Trunk uses the G.729 coder whenever possible. Note that this Allowed Coders Group ID was assigned to the IP Profile belonging to the Broadvox SIP Trunk in the previous step (see Section 4.6 on page 44).

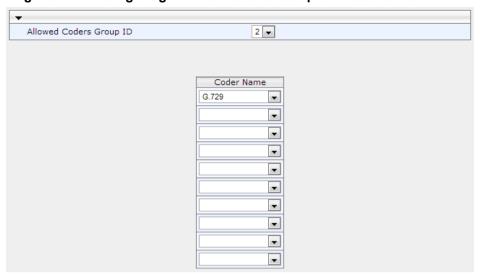

#### To set a preferred coder for the Broadvox SIP Trunk:

- Open the Allowed Coders Group page (Configuration tab > VolP menu > SBC > Allowed Coders Group).
- Configure an Allowed Coder as follows:

Parameter	Value
Allowed Coders Group ID	2
Coder Name	G.729

Figure 4-17: Configuring Allowed Coders Group for Broadvox SIP Trunk

 Open the General Settings page (Configuration tab > VolP menu > SBC > General Settings).

Figure 4-18: SBC Preferences Mode

- 4. From the 'SBC Preferences Mode' drop-down list, select **Include Extensions**.
- 5. Click Submit.

# 4.8 Step 8: SIP TLS Connection Configuration

This section describes how to configure the E-SBC for using a TLS connection with the Lync Server 2013 Mediation Server. This is essential for a secure SIP TLS connection.

### 4.8.1 Step 8a: Configure the NTP Server Address

This step describes how to configure the NTP server's IP address. It is recommended to implement an NTP server (Microsoft NTP server or a third-party server) to ensure that the E-SBC receives the accurate and current date and time. This is necessary for validating certificates of remote parties.

#### > To configure the NTP server address:

- Open the Application Settings page (Configuration tab > System > Application Settings).
- 2. In the 'NTP Server IP Address' field, enter the IP address of the NTP server (e.g., 10.15.25.1).

Figure 4-19: Configuring NTP Server Address

3. Click Submit.

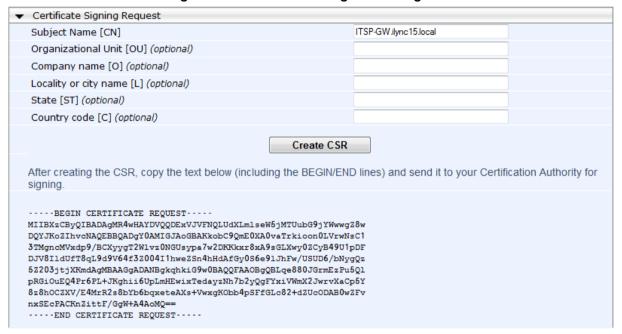

### 4.8.2 Step 8b: Configure a Certificate

This step describes how to exchange a certificate with Microsoft Certificate Authority (CA). The certificate is used by the E-SBC to authenticate the connection with Lync Server 2013.

The procedure involves the following main steps:

- a. Generating a Certificate Signing Request (CSR).
- b. Requesting Device Certificate from CA.
- Obtaining Trusted Root Certificate from CA.
- d. Deploying Device and Trusted Root Certificates on E-SBC.
- > To configure a certificate:
- 1. Open the Certificates page (Configuration tab > System > Certificates).

Figure 4-20: Certificates Page - Creating CSR

2. In the 'Subject Name' field, enter the media gateway name (e.g., ITSP-GW.ilync15.local).

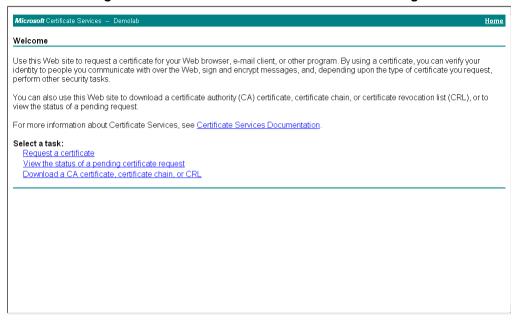

Note: The value entered in this field must be identical to the gateway name configured in the Topology Builder for Lync Server 2013 (see Section 3.1 on page 15.

- 3. Click Create CSR; a certificate request is generated.
- 4. Copy the CSR from the line "----BEGIN CERTIFICATE" to "END CERTIFICATE REQUEST----" to a text file (such as Notepad), and then save it to a folder on your computer with the file name, *certreq.txt*.

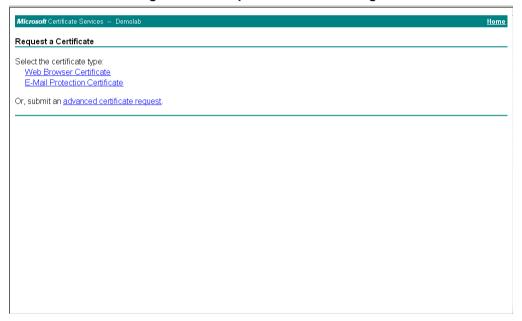

**5.** Open a Web browser and navigate to the Microsoft Certificates Services Web site at http://<certificate server>/CertSrv.

Figure 4-21: Microsoft Certificate Services Web Page

6. Click Request a certificate.

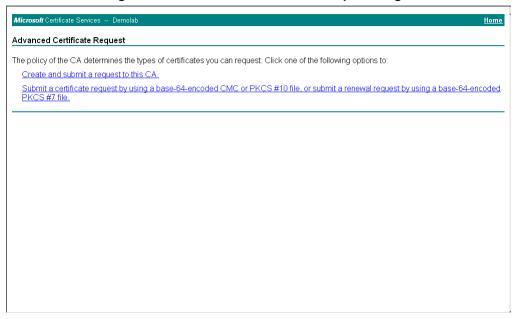

Figure 4-22: Request a Certificate Page

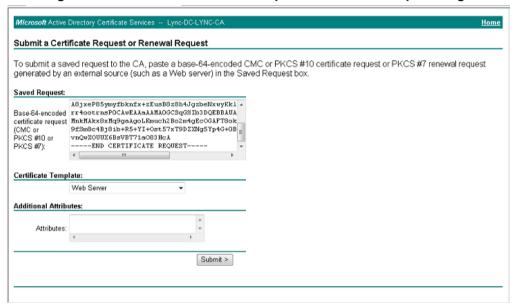

Click advanced certificate request and then click Next.

Figure 4-23: Advanced Certificate Request Page

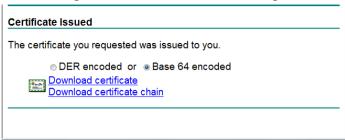

8. Click Submit a certificate request ..., and then click Next.

Figure 4-24: Submit a Certificate Request or Renewal Request Page

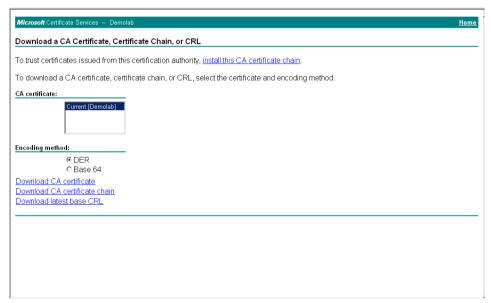

- **9.** Open the *certreq.txt* file that you created and saved in Step 4, and then copy its contents to the 'Saved Request' field.
- 10. From the 'Certificate Template' drop-down list, select Web Server.
- 11. Click Submit.

Figure 4-25: Certificate Issued Page

- Select the Base 64 encoded option for encoding, and then click Download certificate.
- **13.** Save the file as *gateway.cer* to a folder on your computer.
- **14.** Click the **Home** button or navigate to the certificate server at http://<Certificate Server>/CertSrv.
- 15. Click Download a CA certificate, certificate chain, or CRL.

Figure 4-26: Download a CA Certificate, Certificate Chain, or CRL Page

- 16. Under the 'Encoding method' group, select the Base 64 option for encoding.
- 17. Click Download CA certificate.
- 18. Save the file as certroot.cer to a folder on your computer.
- 19. In the E-SBC's Web interface, return to the Certificates page and do the following:
  - a. In the 'Device Certificate' field, click Browse and select the gateway.cer certificate file that you saved on your computer in Step 13, and then click Send File to upload the certificate to the E-SBC.
  - b. In the 'Trusted Root Certificate Store' field, click Browse and select the certroot.cer certificate file that you saved on your computer in Step 18, and then click Send File to upload the certificate to the E-SBC.

Figure 4-27: Certificates Page (Uploading Certificate)

**20.** Reset the E-SBC with a burn to flash for your settings to take effect (see Section 4.15 on page 70).

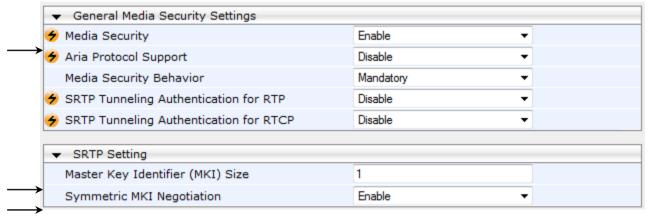

# 4.9 Step 9: Configure SRTP

This step describes how to configure media security. If you configure the Microsoft Mediation Server to use SRTP, you need to configure the E-SBC to operate in the same manner. Note that SRTP was enabled for Lync Server 2013 when you configured an IP Profile for Lync Server 2013 (see Section 4.6 on page 44).

- > To configure media security:
- 1. Open the Media Security page (Configuration tab > Media menu > Media Security).
- 2. Configure the parameters as follows:

Parameter	Value
Media Security	Enable
Master Key Identifier (MKI) Size	1
Symmetric MKI Negotiation	Enable

Figure 4-28: Configuring SRTP

- 3. Click Submit.
- Reset the E-SBC with a burn to flash for your settings to take effect (see Section 4.15 on page 70).

### 4.10 Step 10: Configure Maximum IP Media Channels

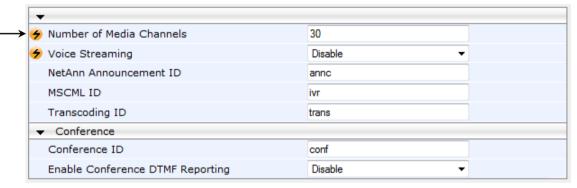

This step describes how to configure the maximum number of required IP media channels. The number of media channels represents the number of DSP channels that the E-SBC allocates to call sessions.

Note: In current configuration DSP channels mandatory required.

- To configure the maximum number of IP media channels:
- Open the IP Media Settings page (Configuration tab > VoIP menu > IP Media > IP Media Settings).

Figure 4-29: Configuring Number of IP Media Channels

- 2. In the 'Number of Media Channels' field, enter the number of media channels according to your environments transcoding calls (e.g., **30**).
- 3. Click Submit.
- **4.** Reset the E-SBC with a burn to flash for your settings to take effect (see Section 4.15 on page 70).

# 4.11 Step 11: Configure IP-to-IP Call Routing Rules

This step describes how to configure IP-to-IP call routing rules. These rules define the routes for forwarding SIP messages (e.g., INVITE) received from one IP entity to another. The E-SBC selects the rule whose configured input characteristics (e.g., IP Group) match those of the incoming SIP message. If the input characteristics do not match the first rule in the table, they are compared to the second rule, and so on, until a matching rule is located. If no rule is matched, the message is rejected. The routing rules use the configured IP Groups to denote the source and destination of the call. As configured in Section 4.5 on page 42, IP Group 1 represents Lync Server 2013, and IP Group 2 represents Broadvox SIP Trunk.

For the interoperability test topology, the following IP-to-IP routing rules need to be configured to route calls between Lync Server 2013 (LAN) and Broadvox SIP Trunk (WAN):

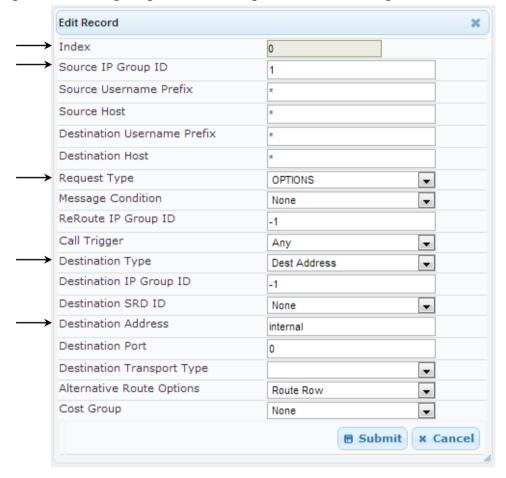

- Terminate SIP OPTIONS messages on the E-SBC that are received from the LAN
- Calls from Lync Server 2013 to Broadvox SIP Trunk
- Calls from Broadvox SIP Trunk to Lync Server 2013

- To configure IP-to-IP routing rules:
- 1. Open the IP-to-IP Routing Table page (Configuration tab > VoIP menu > SBC > Routing SBC > IP-to-IP Routing Table).
- 2. Configure a rule to terminate SIP OPTIONS messages received from the LAN:

Parameter	Value
Index	0
Source IP Group ID	1
Request Type	OPTIONS
Destination Type	Dest Address
Destination Address	internal

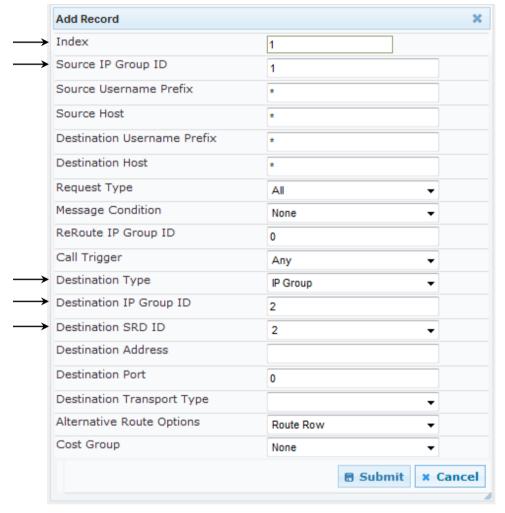

Figure 4-30: Configuring IP-to-IP Routing Rule for Terminating SIP OPTIONS from LAN

3. Configure a rule to route calls from Lync Server 2013 to Broadvox SIP Trunk:

Parameter	Value
Index	1
Source IP Group ID	1
Destination Type	IP Group
Destination IP Group ID	2
Destination SRD ID	2

Figure 4-31: Configuring IP-to-IP Routing Rule for LAN to WAN

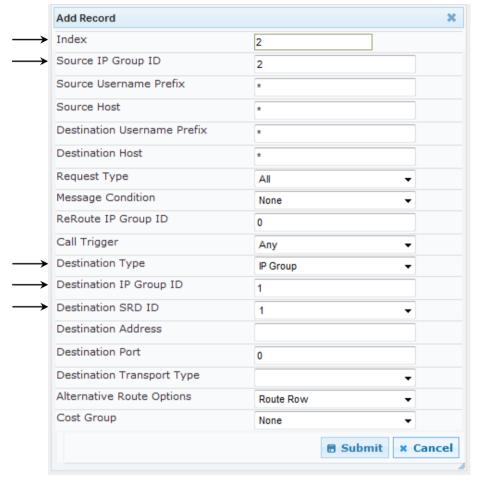

4. Configure a rule to route calls from Broadvox SIP Trunk to Lync Server 2013:

Parameter	Value
Index	2
Source IP Group ID	2
Destination Type	IP Group
Destination IP Group ID	1
Destination SRD ID	1

Figure 4-32: Configuring IP-to-IP Routing Rule for WAN to LAN

The configured routing rules are shown in the figure below:

Figure 4-33: Configured IP-to-IP Routing Rules in IP-to-IP Routing Table

**Note:** The routing configuration may change according to your specific deployment topology.

# 4.12 Step 12: Configure IP-to-IP Manipulation Rules

This step describes how to configure IP-to-IP manipulation rules. These rules manipulate the source and / or destination number. The manipulation rules use the configured IP Groups to denote the source and destination of the call. As configured in Section 4.5 on page 42, IP Group 1 represents Lync Server 2013, and IP Group 2 represents Broadvox SIP Trunk.

**Note:** Adapt the manipulation table according to you environment dial plan.

For this interoperability test topology, a manipulation is configured to add the "+" (plus sign) to the destination number for calls from IP Group 2 (Broadvox SIP Trunk) to IP Group 1 (i.e., Lync Server 2013) for any destination username prefix.

#### > To configure a number manipulation rule:

- 1. Open the IP-to-IP Outbound Manipulation page (Configuration tab > VoIP menu > SBC > Manipulations SBC > IP-to-IP Outbound).
- 2. Click Add.
- 3. Click the **Rule** tab, and then configure the parameters as follows:

Parameter	Value
Index	0
Source IP Group ID	2
Destination IP Group ID	1
Destination Username Prefix	* (asterisk sign)
Manipulated URI	Destination

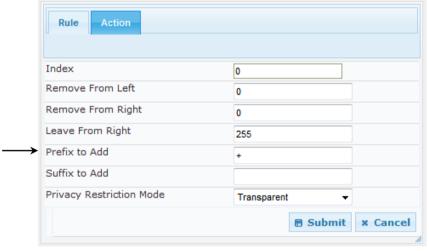

Action Index 0 Additional Manipulation No Source IP Group ID 2 ➤ Destination IP Group ID 1 Source Username Prefix Source Host Destination Username Prefix Destination Host Request Type ReRoute IP Group ID -1 Call Trigger Any Manipulated URI Destination **■ Submit** x Cancel

Figure 4-34: Configuring IP-to-IP Outbound Manipulation Rule - Rule Tab

4. Click the **Action** tab, and then configure the parameters as follows:

Parameter	Value
Prefix to Add	+ (plus sign)

Figure 4-35: Configuring IP-to-IP Outbound Manipulation Rule - Action Tab

#### 5. Click Submit.

The figure below shows an example of configured IP-to-IP outbound manipulation rules for calls between IP Group 1 (i.e., Lync Server 2013) and IP Group 2 (i.e., Broadvox SIP Trunk):

Figure 4-36: Example of Configured IP-to-IP Outbound Manipulation Rules

Rule Index	Description				
0	Calls from IP Group 2 to IP Group 1 with any destination number (*), add "+" to the prefix of the destination number.				
1	Calls from IP Group 1 to IP Group 2 with the prefix destination number "+", remove "+" from this prefix.				
2	Calls from IP Group 1 to IP Group 2 with source number prefix "+", remove the "+" from this prefix.				

### 4.13 Step 13: Configure Registration Accounts

This step describes how to configure SIP registration accounts. This is required so that the E-SBC can register with the Broadvox SIP Trunk on behalf of Lync Server 2013. The Broadvox SIP Trunk requires registration and authentication to provide service.

In the interoperability test topology, the Served IP Group is Lync Server 2013 (IP Group 1) and the Serving IP Group is Broadvox SIP Trunk (IP Group 2).

#### > To configure a registration account:

Open the Account Table page (Configuration tab > VolP menu > SIP Definitions >
 Account Table).

Figure 4-37: Configuring SIP Registration Account

Index	Served Trunk Group	Served IP Group	Serving IP Group	User Name	Password	Host Name	Register	Contact User	Application Type
0 0	-1	1	2	4085827132	*	dn01-05.fs.broadvox.net	Yes	4085827132	SBC

- 2. Enter an index number (e.g., "0"), and then click Add.
- **3.** Configure the account according to the provided information from Broadvox, for example:

Parameter	Value
Served IP Group	1 (Lync Server 2013)
Serving IP Group	2 (Broadvox SIP Trunk)
Username	<b>4085827132</b> (As provided by Broadvox)
Password	*** (As provided by Broadvox)
Host Name	dn01-05.fs.broadvox.net
Register	Yes
Contact User	4085827132 (SIP Trunk Pilot Line)
Application Type	SBC

4. Click Apply.

### 4.14 Step 14: Miscellaneous Configuration

This section describes miscellaneous E-SBC configuration.

### 4.14.1 Step 14a: Configure DNS Query Methods

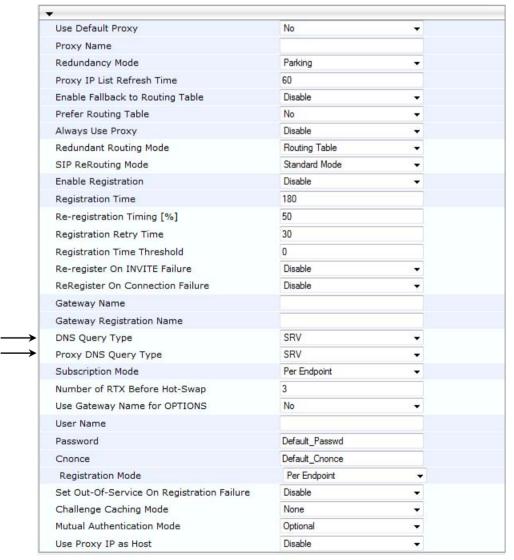

This step describes how to configure DNS query modes. Broadvox uses an SRV-based DNS server for FQDN resolution to IP address for the Proxy Set (i.e., SIP Trunk).

#### To configure DNS query methods:

- Open the Proxy & Registration page (Configuration tab > VolP menu > SIP Definitions > Proxy & Registration).
- 2. Configure the following parameters:

Parameter	Value
DNS Query Type	SRV
Proxy DNS Query Type	SRV

Figure 4-38: Configuring DNS Query Methods

### 4.14.2 Step 14b: Configure Call Forking Mode

This step describes how to configure the E-SBC's handling of SIP 18x responses received for call forking of INVITE messages. For the interoperability test topology, if a SIP 18x response with SDP is received, the E-SBC opens a voice stream according to the received SDP. The E-SBC re-opens the stream according to subsequently received SIP 18x responses with SDP or plays a ringback tone if a SIP 180 response without SDP is received. It's mandatory to set this field for the Lync Server 2013 environment.

#### > To configure call forking:

- Open the General Settings page (Configuration tab > VolP menu > SBC > General Settings).
- 2. From the 'SBC Forking Handling Mode' drop-down list, select **Sequential**.

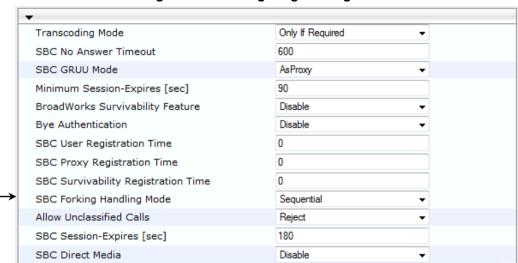

Figure 4-39: Configuring Forking Mode

3. Click Submit.

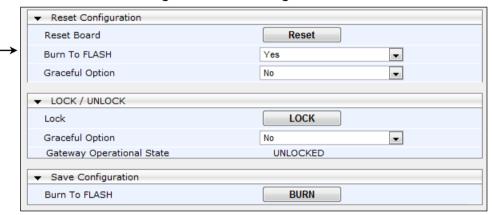

# 4.15 Step 15: Reset the E-SBC

After you have completed the configuration of the E-SBC described in this chapter, save ("burn") the configuration to the E-SBC's flash memory with a reset for the settings to take effect.

- > To save the configuration to flash memory:
- Open the Maintenance Actions page (Maintenance tab > Maintenance menu > Maintenance Actions).

Figure 4-40: Resetting the E-SBC

- 2. Ensure that the 'Burn to FLASH' field is set to Yes (default).
- 3. Click the **Reset** button.

# Appendix A AudioCodes INI File

The *ini* configuration file of the E-SBC, corresponding to the Web-based configuration as described in Section 4 on page 31, is shown below:

Note: To load and save an *ini* file, use the Configuration File page (Maintenance tab > Software Update menu > Configuration File).
